Command	Input	Output	Description
`stream()`	Collection	Sequential Stream	Creates a sequential Stream from a Collection.
`parallelStream()`	Collection	Parallel Stream	Creates a parallel Stream from a Collection.
`filter(predicate)`	Stream	Stream with filtered elements	Filters elements of a Stream based on a given predicate.
`limit(n)`	Stream	Stream with limited elements	Limits the number of elements in a Stream.
`forEach(action)`	Stream	Side-effect (action performed on each element)	Performs an action for each element of the Stream.
`map(mapper)`	Stream	Stream with mapped elements	Transforms each element of a Stream using a given function.
`flatMap(mapper)`	Stream of Streams	Stream with flattened elements	Flattens nested Streams into a single Stream.
`toArray()`	Stream	Array	Converts a Stream into an array.
`collect(Collectors.toList())`	Stream	Collection	Collects the elements of a Stream into a Collection.
`count()`	Stream	Count of elements	Counts the number of elements in a Stream.
`min(comparator)`	Stream	Optional with minimum element	Finds the minimum element of a Stream based on a comparator.
`max(comparator)`	Stream	Optional with maximum element	Finds the maximum element of a Stream based on a comparator.
`distinct()`	Stream	Stream with distinct elements	Removes duplicate elements from a Stream.
`reduce(identity, accumulator)`	Stream	Optional with reduced value	Reduces the elements of a Stream into a single value using an associative accumulation function.
`mapToInt(mapper)`	Stream	IntStream	Converts a Stream of primitive wrapper types to an IntStream.
`sorted()`	Stream	Stream with sorted elements	Sorts the elements of a Stream.
`sorted(comparator)`	Stream	Stream with sorted elements (custom order)	Sorts the elements of a Stream using a custom Comparator.
`anyMatch(predicate)`	Stream	Boolean (true/false)	Checks if any element of a Stream matches a given predicate.
`allMatch(predicate)`	Stream	Boolean (true/false)	Checks if all elements of a Stream match a given predicate.
`noneMatch(predicate)`	Stream	Boolean (true/false)	Checks if none of the elements of a Stream match a given predicate.
`findAny()`	Stream	Optional with any element	Finds any element of a Stream.
`findFirst()`	Stream	Optional with first element	Finds the first element of a Stream.
`Stream.concat(stream1, stream2)`	Two Streams	Concatenated Stream	Concatenates two Streams into a single Stream.
